### **Executive Summary**

Riverside has created a Local Roadway Safety Plan (LRSP), which identifies a framework to identify, analyze, and develop traffic safety enhancements on the City's roadway network. The LRSP was developed in response to local issues and needs. Through the analysis, this report has identified emphasis areas to inform and further guide safety evaluation and planning for the City's transportation network. The LRSP also analyzes collision data on an aggregate basis as well as at specific locations to identify high-crash locations, high-risk locations, and citywide trends and patterns. The analysis of collision history on the City's transportation network allows for opportunities to:

- 1. Identify factors in the transportation network that inhibit safety for all roadway users,
- 2. Improve safety at specific high-crash locations, and
- Develop safety measures using the four E's of safety: Engineering, Enforcement, Education, and Emergency Response to encourage safer driver behavior and better severity outcomes.

With this LRSP, the City continues its safety efforts by identifying areas of emphasis and systemic recommendations to enhance safety.

The City's vision is to enhance the transportation network and reduce traffic fatalities and serious injury related crashes, and the goals for the City of Riverside include the following:

Goal #1: Identify areas with a high risk for crashes.

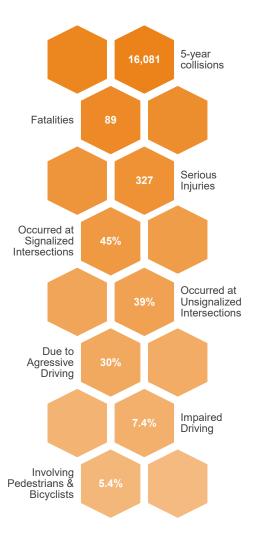

**Goal #2:** Illustrate the value of a comprehensive safety program and the systemic process.

**Goal #3:** Plan future safety improvements for near-, midand long-term.

**Goal #4:** Define safety projects for HSIP and other program funding consideration.

This LRSP analyzes the most recent range of crash data (July 1, 2017 – June 30, 2022) and roadway improvements to assess historic trends, patterns, and areas of increasing concern.

Further, the collision history was analyzed to identify locations with elevated risk of collisions either through their collision histories or their similarities to other locations with more

Source: Riverside Collision Database (2017- 2022)

active collision patterns. Using a network screening process, locations were identified within the City that will most likely benefit from safety enhancements. Using historic collision data, collision risk factors for the entire network were derived. The outcomes informed the identification and prioritization of engineering and non-infrastructure safety measures to address certain roadway characteristics and related behaviors that contribute to motor vehicle collisions with active transportation users.

Emphasis areas were developed by revisiting the vision and goals developed at the onset of the planning process and comparing them with the trends and patterns identified in the crash analysis.

Emphasis Area #1: Vulnerable Road Users (Pedestrians & Bicyclists)

Emphasis Area #2: Impaired Drivers

Emphasis Area #3: Intersection Improvements

Emphasis Area #4: Aggressive Driving

The following 12 case study locations were chosen to be representative of the corridor and intersection configurations throughout the City.

- 1. Signalized Intersection: Market St & 6<sup>th</sup> St
- 2. Roadway Segment: Mission Inn Ave Redwood Dr to Scout Ln
- 3. Roadway Segment: Main St Spruce St to Poplar St
- 4. Signalized Intersection: 14<sup>th</sup> St & Olivewood Ave
- 5. Unsignalized Intersection: Victoria Ave & Lincoln Ave
- 6. Unsignalized Intersection: Washington St & Lincoln Ave
- 7. Signalized Intersection: Van Buren Boulevard & Wood Rd
- 8. Unsignalized Intersection: Tyler St & Hemet St
- 9. Signalized Intersection: Tyler St & Magnolia Ave
- **10.** Signalized Intersection: Van Buren Blvd & Arlington Ave
- 11. Signalized Intersection: Van Buren Blvd & Jurupa Ave
- **12.** Roadway Segment: Central Ave Fremont St to Wilderness Ave

These locations were identified through the analysis process based on their crash histories, stakeholder engagement, the observed crash patterns, and their different characteristics to provide the most insight into potential systemic safety countermeasures that the City can employ to achieve the most cost-effective safety benefits. Countermeasures were subjected to a benefit/cost assessment and scored according to their potential return on investment. These case studies can be used to select the most appropriate countermeasure, and to potentially phase improvements over the longer-term. The potential benefit of these countermeasures at locations

with similar design characteristics can then be extrapolated regardless of crash history, allowing for proactive safety enhancements that can prevent future safety challenges from developing. Additionally, this information can be used to help the City apply for grants and other funding opportunities to implement these safety improvements. These opportunities were assembled into the "countermeasure toolbox" shown below. The toolbox shows the crash reduction factor, which is the factor used to estimate the expected reduction in number of crashes after implementing a given countermeasure at a specific site (the higher the CRF, the greater the expected reduction in crashes). The toolbox also shows the countermeasure ID number from the California Local Roadway Safety Manual.

### Citywide Countermeasure Toolbox

| ID                 | Potential Countermeasures   | Where to apply?                                       | Crash<br>Reduction<br>Factor | Per Unit<br>Cost | Unit             |
|--------------------|---|---|------------------------------|------------------|------------------|
| S02                | Improve signal hardware; lenses, back-plates                                | Signalized intersections with significant broadside   | 15%                          | \$26,400         | per intersection |
|                    | with retroreflective borders, mounting, size, and number                    | and rear-end collisions due to signal visibility      |                              |                  |                  |
|                    |   |   |                              |                  |                  |
| S04                | Provide Advanced Dilemma Zone Detection                                     | Signalized intersections with significant right-angle | 40%                          | \$76,800         | per intersection |
|                    | system  | and rear-end collisions due to unsafe stopping        |                              |                  |                  |
|                    |   | during yellow phases                                  |                              |                  |                  |
| S10                | Install flashing beacons as advance warning for<br>signalized intersections | Locations with sight distance issues                  | 30%                          | \$10,200         | per beacon       |
| S17PB <sup>1</sup> | Install audible pedestrian push button systems                              | Signalized intersections with crosswalks              | 25%                          | \$11,000         | Per intersection |
| S18PB              | Install high visibility crosswalk for signalized                            | Signalized intersections with no marked crossing      | 25%                          | \$74,400         | per intersection |
|                    | intersections   | and pedestrian heads, with significant turning        |                              |                  |                  |
|                    |   | movements   |                              |                  |                  |
| S21PB              | Modify signal phasing to implement a Leading                                | Signalized Intersections – especially those with      | 60%                          | \$45,600         | per intersection |
|                    | Pedestrian Interval (LPI)   | high pedestrian activity                              |                              |                  |                  |
| NS03               | Install signals   | Unsignalized intersections with significant collision | 30%                          | \$378,000        | per intersection |
|                    |   | activity where warrants are met                       |                              |                  |                  |
| NS05mr             | Convert intersection to mini-roundabout                                     | Intersections with lower vehicle speeds, with         | 30%                          | \$100,000        | per location     |
|                    |   | posted speed limits of 30 mph or less                 |                              |                  |                  |
| NS06               | Install/upgrade larger or additional stop signs or                          | Unsignalized intersections with crash history         | 15%                          | \$8,400          | por sign         |
|                    | other intersection warning/regulatory signs                                 | showing running stop signs                            | 1370                         | φ0,400           | per sign         |
| NS08               | Install Flashing Beacons at Stop-Controlled                                 | Unsignalized intersections with crash history         | 15%                          |                  |                  |
|                    | Intersections   | showing running stop signs                            | 13%                          | \$12,000         | per beacon       |
|                    |   |   | 1                            |                  |                  |

<sup>1</sup> This countermeasure typically covers pedestrian countdown signal heads, but can be also used for audible pedestrian push buttons

| ID     | Potential Countermeasures                     | Where to apply?                                       | Crash<br>Reduction<br>Factor | Per Unit<br>Cost | Unit             |
|--------|---|---|------------------------------|------------------|------------------|

\*The City is not limited to the countermeasures in this toolbox and can utilize other approved countermeasures in its roadway safety planning.

Near-term action items were identified to accelerate the City's achievement of the goals and vision of this LRSP. The City can:

- Actively seek other funding opportunities to improve safety for all modal users,
- Collaborate with established safety partners & neighboring municipalities as improvements are made to create a cohesive transportation network, and
- Iteratively evaluate existing and proposed transportation safety programs and capital improvements to design a safer transportation network in Riverside.

The City will be regularly monitored and update the analysis performed in this plan. A full plan update will completed five years from the City Council's adoption of this plan which will maintain eligibility for HSIP funding.

### **1. Introduction**

Located in Riverside County about 50 miles southeast of Downtown Los Angeles, the City of Riverside is a city with a population of 314,998 according to the 2020 census. **Figure 1** shows vital statistics for the City of Riverside.

### Figure 1 - Riverside City Profile

Source: City of Riverside

Riverside is a medium-sized city with shopping, food, entertainment, and outdoor recreation. Based on University of California Berkeley's Transportation Injury Mapping System (TIMS) and California Department of Transportation (Caltrans) Vehicle Operation Cost Parameters, Riverside's economic losses due to traffic injuries amounted to approximately \$1.3B from 2017 to 2021. This report identifies factors associated with the most vehicle crashes particular to the City and proposes matching countermeasures to reduce or eliminate those crashes.

This Local Road Safety Plan (LRSP) identifies emphasis areas to inform and guide further safety evaluation of the City's transportation network. The emphasis areas include the type of crash, certain locations, and notable relationships between current efforts and crash history. The LRSP analyzes crash data on an aggregate basis as well as at specific locations to identify high-crash locations, high-risk locations, and city-wide trends and patterns. The analysis of crash history throughout the City's transportation network allows for the following opportunities:

- 1. Identify factors in the transportation network that inhibit safety for all roadway users,
- 2. Improve safety at specific high-crash locations, and

3. Develop safety measures using the four E's of safety (Engineering, Enforcement, Education, and Emergency Response) to encourage safer driver behavior and better severity outcomes.

Riverside has taken steps to enhance all modal safety throughout the City and with this LRSP, Riverside is continuing to prioritize safety in its planning processes. The Office of Traffic Safety (OTS) most recently ranked Riverside 8 out of 15 peer cities for traffic injuries after normalizing for population and VMT in 2019. With number one (1) in the OTS crash rankings considered the highest, or "worst," this positions the City at slightly below average for roadway safety performance. This LRSP analyzes the most recent range of Crossroads crash data from July 1, 2017 – June 30, 2022 and roadway improvements to assess historic trends, patterns, and areas of increasing concern.

The intent of the LRSP is to:

- Create a greater awareness of road safety and risks
- Reduce the number of fatal and severe-injury crashes
- Develop lasting partnerships
- Support for grant/funding applications, and
- Prioritize investments in traffic safety.

### 2. Vision and Goals

The Riverside LRSP evaluates the transportation network as well as non-infrastructure programs and policies within the City. Mitigation measures are evaluated using criteria to analyze the safety of road users (drivers, bicyclists, and pedestrians), the interaction of modes, the influences on the roadway network from adjacent municipalities, and the potential benefits of safety countermeasures. Through historical data and trends, proactive identification and safety opportunities can be identified and implemented without relying solely on a reaction and response to crashes as they occur.

As cities across the country have implemented LRSPs and systemically addressed the conditions leading to fatal and severe-injury crashes, the Federal Highway Administration (FHWA) has found that LRSPs effectively improve safety. LRSPs provide a locally developed and customized roadmap to directly address the most common safety challenges in the given jurisdiction. This project's vision, goals, and objectives have been established to reflect discussions with Riverside staff, various stakeholders identified by City staff, and a review of existing plans/policies in the area.

# **VISION:** To enhance the transportation network for all users to move towards zero traffic fatalities and serious injuries

### Goal #1: Identify areas with a high risk for crashes.

### **Objectives:**

- Identify intersections and segments that would most benefit from mitigation.
- Identify areas of interest with respect to safety concerns for vulnerable users (pedestrians and bicyclists).

# Goal #2: Illustrate the value of a comprehensive safety program and the systemic process. **Objectives:**

- Demonstrate the systemic process' ability to identify locations with higher risk for crashes based on present characteristics closely associated with severe crashes.
- Demonstrate, through the systemic process, the gaps and data collection activities that can be improved upon.

### Goal #3: Plan future safety improvements for near-, mid- and long-term.

### **Objectives:**

- Identify safety countermeasures for specific locations (case studies).
- Identify safety countermeasures that can be applied city-wide.

Goal #4: Define safety projects for future Highway Safety Improvement Plan (HSIP) and other program funding consideration.

**Objectives:** 

- Create the outline for a prioritization process that can be used in this and forth-coming cycles to apply for funding.
- Use the systemic process to create Project Case Studies.
- Use Case Studies to apply for HSIP and other funding consideration.
- Demonstrate the correlation between the proposed safety countermeasures with the Vision Zero Initiative and the California State Highway Safety Plan.

### 3. Process

The primary goal for the City of Riverside and their safety partners is to provide safe, sustainable, and efficient mobility choices for their residents and visitors. Through the development and implementation of this LRSP, the City will continue its collaboration with safety partners to identify and discuss safety issues within the community.

Guidance on the LRSP process is provided at both the national (FHWA) and state (Caltrans) level, and both agencies have developed a general framework of data and recommendations for a LRSP.

FHWA encourages the following:

- The establishment of a working group (stakeholders) to participate in developing an LRSP
- A review of crash, traffic, and roadway data to identify areas of concern
- The identification of goals, priorities, and countermeasures to recommend improvements at spot locations, systemically, and comprehensively

Caltrans guidance follows a similar outline with the following steps:

- Establish leadership
- Analyze the safety data
- Determine emphasis areas
- Identify strategies
- Prioritize and incorporate strategies
- Evaluate and update the LRSP

This LRSP documents the results of data and information obtained, including the preliminary vision and goals for the LRSP, existing safety efforts, initial crash analysis, and developed emphasis areas. The LRSP recommendations consider the four E's of traffic safety defined by the California Strategic Highway Safety Plan (SHSP): Engineering, Enforcement, Education, and Emergency Response.

### 3.1 Guiding Manuals

This section describes the analysis process undertaken to evaluate safety within Riverside at a systemic level. This report identifies specific locations within the City that will benefit from safety enhancements and derives crash risk factors based on historic crash data using a network screening process. The outcome will inform the identification and prioritization of engineering and non-infrastructure safety measures by addressing certain roadway characteristics and related driving behaviors contributing to crashes. This process uses the latest national and state best practices for statistical roadway analysis described.

### 3.1.1 Local Roadway Safety Manual

The *Local Roadway Safety Manual: A Manual for California's Local Road Owners* (Version 1.5, April 2020) encourages local agencies to pursue a proactive approach when identifying and analyzing safety issues and preparing to compete for project funding opportunities. A proactive approach is the analyzation of safety in an entire roadway network through either a one-time network wide analysis or a routine analysis of the roadway network.<sup>2</sup>

According to the *Local Roadway Safety Manual* (LRSM), "the California Department of Transportation (Caltrans) – Division of Local Assistance is responsible for administering California's federal safety funding intended for local safety improvements."

To provide the most beneficial and competitive funding approach, the analysis leading to countermeasure selection should focus on both intersections and roadway segments and maintain consideration of roadway characteristics and traffic volumes. The result should reflect a list of locations that are most likely to benefit from cost-effective countermeasures, preferably prioritized by benefit/cost ratio. The manual suggests using a mixture of quantitative and qualitative measures to identify and rank locations using both crash frequency and crash rates. These findings should then be screened for crash type and severity patterns to determine the cause of crashes and the potential effective countermeasures. Qualitative analysis should include field visits and a review of existing roadway characteristics and devices. The specific roadway context can then be used to assess conditions that may decrease safety at the site and at systematic levels.

Countermeasure selection should be supported using Crash Modification Factors (CMFs). These factors are a peer reviewed product of research quantifying the expected rate of crash reduction expected from a given countermeasure. If more than one countermeasure is under consideration, the LRSM provides guidance on appropriate application of CMFs.

### 3.1.2 Highway Safety Manual

The American Association of State Highway and Transportation Officials (AASHTO) *Highway Safety Manual* (HSM), published in 2010, presents a variety of methods for quantitatively estimating crash frequency or severity at a variety of locations.<sup>3</sup> This four-part manual is divided into the following parts: A) Introduction, Human Factors, and Fundamentals, B) Roadway Safety Management Process, C) Predictive Method, D) Crash Modification Factors.

In Chapter 4 of Part B in the HSM, the "Network Screening Process" is a tool for an agency to analyze the entire network and identify/rank locations that are most likely or least likely to realize a reduction in the frequency of crashes.

<sup>&</sup>lt;sup>2</sup> Local Roadway Safety Manual (Version 1.5) 2020. Page 5.

<sup>&</sup>lt;sup>3</sup> AASHTO, Highway Safety Manual, 2010, Washington D.C., http://www.highwaysafetymanual.org/Pages/About.aspx

The HSM identifies five steps in this process:<sup>4</sup>

- 1. Establish Focus: Identify the purpose or intended outcome of the network screening analysis. This decision will influence data needs, the selection of performance measures and the screening method that can be applied.
- 2. Identify Network and Establish Reference Populations: Specify the types of sites or facilities being screened (i.e., segments, intersections, geometrics) and identify groupings of similar sites or facilities.
- 3. Select Performance Measures: There are a variety of performance measures available to evaluate the potential to reduce crash frequency at a site. In this step, the performance measure is selected as a function of the screening focus and the data and analytical tools available.
- **4. Select Screening Method:** There are three principal screening methods described in this chapter (i.e., ranking, sliding window, peak searching). Each method has advantages and disadvantages; the most appropriate method for a given situation should be selected.
- 5. Screen and Evaluate Results: The final step in the process is to conduct the screening and analysis and evaluate the results.

The HSM provides several statistical methods for screening roadway networks and identifying high risk locations based on overall crash histories.

### 3.2 Analysis Techniques

### 3.2.1 Collision and Network Screening Analysis

Intersections and roadways were analyzed using four collision metrics:

- Number of Collisions
- Critical Crash Rate (HSM Ch. 4)
- Probability of Specific Crash Types Exceeding Threshold Proportion (HSM Ch. 4)
- Equivalent Property Damage Only (HSM Ch. 4)

The initial steps of the collision analysis established sub-populations of roadway segments and intersections that have similar characteristics. For this study, intersections were grouped by their control type (Signalized or Unsignalized) and segments by their roadway category (Major Arterial, Primary Arterial, Secondary Arterial, Collector Arterial, Local). Individual collision rates were calculated for each sub-population. The population level crash rates were then used to assess whether a specific location has more or fewer crashes than expected. These sub-populations were also used to determine typical crash patterns to help identify locations where unusual numbers of specific crash types are seen.

The network screening process ranks intersections and roadway segments by the number of crashes that occurred at each one over the analysis period, and then identifies areas that had more of a given type of crash than would be expected for that type of location. These crash type factors were 1) collision injury

(fatal, serious injury, other visible injury, complaint of pain, property damage only), 2) collision type (broadside, rear-end, sideswipe, head-on, hit object, overturned, bicycle, pedestrian, other), 3) environmental factors (lighting, wet roads), 4) driver behavior (aggressive), and 5) driver impairment. With these additional factors, the locations were further analyzed and assigned a new rank.

From the results of the network screening analyses, a short-list of locations was chosen based on crash activity, crash severity, crash patterns, location type, and area of the City of Riverside to provide the greatest variety of locations covering the widest range of safety opportunities for safety toolbox development. The intent is to populate the safety toolbox with mitigation measures that will be applicable to most of the crash activity in the city. Ten locations will ultimately be selected for mitigation analysis.

#### 3.2.2 Statistical Performance Measures

#### Critical Crash Rate (CCR)

Reviewing the number of collisions at a location is a method used to understand the cost to society incurred at the local level; however, it does not give a complete indication of the level of risk for those who use that intersection or roadway segment daily. The Highway Safety Manual describes the Critical Crash Rate method which provides a statistical review of locations to determine where risk is higher than that experienced by other similar locations. It is also the first step in analyzing for patterns that may suggest systemic issues that can be addressed at that location, and proactively at others to prevent new safety challenges from emerging.

The Critical Crash Rate compares the observed crash rate to the expected crash rate at a location based on facility type and volume using a locally calculated average crash rate for the specific type of intersection or roadway segment being analyzed. Based on traffic volumes and a weighted citywide crash rate for each facility type, a critical crash rate threshold is established at the 95% confidence level to determine locations with higher crash rates that are unlikely to be random. The threshold is calculated for each location individually based on its traffic volume and the crash profile of similar facilities.

### Figure 2 – Critical Crash Rate Formula

$$R_{c,i} = R_{a} + \left[ P \times \sqrt{\frac{R_{a}}{MEV_{i}}} \right] + \left[ \frac{1}{(2 \times (MEV_{i}))} \right]$$

Where,

 $R_{c,i}$  = Critical crash rate for intersection *i* 

- Ra = Weighted average crash rate for reference population
- *P* = *P*-value for corresponding confidence level
- MEV<sub>i</sub> = Million entering vehicles for intersection i

#### SOURCE: HIGHWAY SAFETY MANUAL

#### DATA NEEDS

CCR can be calculated using:

- Daily entering volume for intersections, or VMT for roadway segments;
- Intersection control types to separate them into like populations;
- Roadway functional classification to separate them into like populations;
- Collision records in GIS or tabular form including coordinates or linear measures.

#### STRENGTHS

- Reduces low volume exaggeration
- Considers variance
- Establishes comparison threshold

#### **CCR** Methodology

The Process of analyzing the CCR and comparing locations (separately by intersections and segments) is a multi-step process. The following is a high-level description of the process undertaken to develop the initial ranking of locations.

The first step in the process was to establish a city-wide crash rate for each facility population. These populations are broken into two categories with sub-categories:

- Intersection:
  - o Signalized
  - o Unsignalized
- Roadway Classification:
  - Major Arterial
  - o Minor Arterial
  - Collector
  - o Local

The individual crash rate for each location was then calculated based on the associated traffic volume. This volume was either collected through data count resources or calculated based on the roadway classification. The next step was to establish a Significance Threshold. This Threshold was used to determine what level of exceedance (how much the crash rate exceeded the critical crash rate) a location must have based on traffic volume to provide a high level of confidence that the collision occurring at the location is not random. For this study, a confidence level of 95% was used. The local crash rates were then compared to Significance Threshold to see if each location exceeded the expected CCR and if so, by how much. After this analysis was completed, the locations were ranked by their categories according to that level of exceedance.

#### Equivalent Property Damage Only (EPDO)

The equivalent property damage only (EPDO) method is described in the Highway Safety Manual. This method assigns weighting factors to crashes based on injury level (severe, injury, property damage only) to develop a property damage only score. In this analysis, the injury crash costs were calculated for each location (based on the latest Caltrans injury costs). This figure is then divided by the injury cost for a property damage only crash. The resulting number is the equivalent number of property damage only

crashes at each site. This figure allows all locations to be compared based on injury crash costs. (Highway Safety Manual, Chapter 4).

#### **Probability**

The Highway Safety Manual describes the methodology for determining the probability that crash type is greater than an identified threshold proportion. This helps to identify locations where a crash type is more likely to occur.

#### DATA NEEDS

The probability of a specific crash type can be determined using collisions records with location data, and classifications of the locations (intersections or segments) studied.

#### STRENGTHS

- Can be used as a diagnostic tool
- Considers variance in data
- Not affected by selection bias

The HSM methodology first determines the frequency of a specific collision type at an individual location, then determines the observed proportion of that collision type relative to all collision types at that location. A threshold proportion is then determined for the specific collision type; HSM suggests utilizing the proportion of the collision type observed in the entire reference population (e.g. throughout the entire City of Riverside).

These proportions are then utilized to determine the probability that the proportion of a specific crash type is greater than the long-term expected proportion of that crash type.

### Figure 3 – Probability of Specific Crash Types Exceeding Threshold Proportion

$$P(p_i > \overline{p^*_i} \mid N_{observedj}, N_{observedj(TOTAL)}) = 1 - betadist(\overline{p^*_i}, a + N_{observedj}, \beta + N_{observedj(TOTAL)} - N_{observedj})$$

Where:

 $\overline{p_i^*}$  = Threshold proportion

 $p_i$  = Observed proportion

 $N_{observed,i}$  = Observed target crashes for a site *i* 

 $N_{observed i(TOTAL)}$  = Total number of crashes for a site *i* 

#### SOURCE: HIGHWAY SAFETY MANUAL

### 3.3 Future Analysis

The City will conduct regular collision monitoring as described in **Section 10.2**. The City will then refresh the analysis and update the LRSP every 5 years to maintain eligibility for HSIP funding, as described in **Section 10.2**.

### 4. Safety Partners

Local stakeholders were included in the development of this report to ensure the local perspective was maintained at the forefront of planning efforts. A stakeholder group of City staff and external partners consisted of representatives from the Riverside Police Department, Fire Department, Public Works, Riverside School District, University of California, Riverside, and Riverside Bicycle Club.

The local stakeholders were called together to offer insight on the safety issues present in the City's transportation network. After the initial network screening and safety analysis, the stakeholder group met to discuss potential countermeasures and challenge areas through a field visit. The summary of the field visit meeting are outlined below.

### 4.1 Stakeholder Meeting #1

The first stakeholder meeting was conducted virtually on August 4, 2022. At the meeting, stakeholders were introduced to the project and provided an overview of the data used, the required outputs, and the potential outcomes of the study.

In addition to the overview, stakeholders were asked to provide local insight and knowledge at ten "case study" locations that were identified after the initial network screening and crash analysis process.

### 4.2 Field Tour Stakeholder Workshop

On August 8, 2022, the project team visited each of the 12 "case study" locations to identify potential issues that are contributing to the collision patterns. Potential countermeasures were identified and discussed.

### 4.3 Stakeholder Meeting #2

The second stakeholder meeting was conducted virtually on September 1, 2022. During this meeting case study locations were presented to the stakeholders with a list of observations and potential countermeasures. Emphasis/challenge areas were discussed, specifically aggressive driving and impaired driving as a major factor in collisions throughout the City. Stakeholder feedback was reviewed and incorporated into the study process for the development of the LRSP.

## **5. Existing Efforts**

Existing plans, policies, and projects that were recently completed, planned, or on-going were compiled at the start of the LRSP process to gain perspective on the existing efforts for transportation-related improvements within the City. High-level key points regarding transportation improvements and safety-related topics were identified to inform decision making in this LRSP.

**Table 1** outlines the relevant existing City plans and their improvements and funding sources.**Table 2** outlines the relevant existing City projects and their timelines.

## Table 1 – Review of Existing City Plans

| Document Name   | Transportation Policies/Improvements   |

### 6. Data Summary

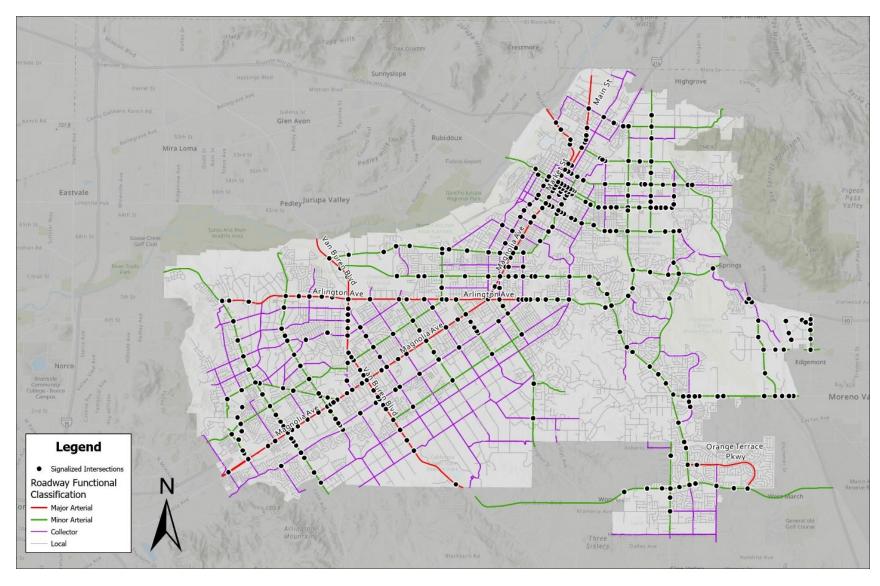

This section describes the data sources used for the analysis process of this LRSP.

### 6.1 Roadway Network

The California Department of Transportation (Caltrans) California Road System (CRS) GIS database was used to build the base roadway network used for this analysis. Intersections and roadway segments were divided into control and classification categories so that each set could have its own crash rates and be compared with similar facilities or control type. Functional Classifications were imported from the city's General Plan and confirmed by city staff. Information on intersection traffic control was provided by the city and included in the analysis network. The collision analysis requires each intersection to be classified by type: Signalized or Unsignalized. **Figure 4** illustrates the City of Riverside's roadway functional classification and intersection control type, respectively, as used for this study.

### 6.2 Collision Data

Collision data was collected from Crossroads software for the period from July 1, 2017 through June 30, 2022, displayed in **Figure 5**. This figure zoomed into each City ward is provided in Appendix A. Five years of data are utilized instead of the standard three years to provide more history to evaluate trends or patterns. Analysis of the raw collision data is the first step in understanding the specific and systemic challenges faced throughout the city. Analyzing the five years of data provided insight on the collision trends and patterns detailed in **Section 7**. The locations of fatal and severe injury collisions are displayed in **Figure 4**. This figure zoomed into each City ward is provided in Appendix A.

## Figure 4 – Functional Classification & Signalized Intersections

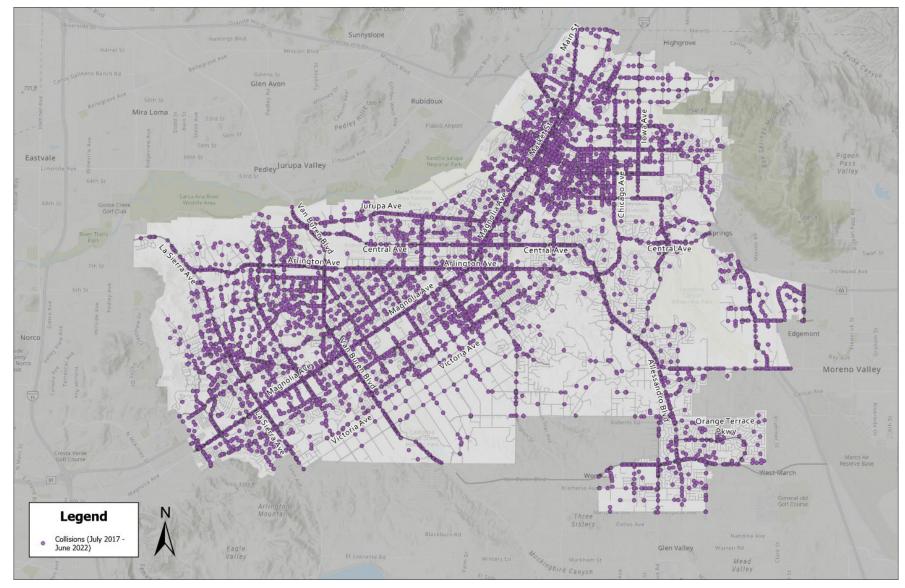

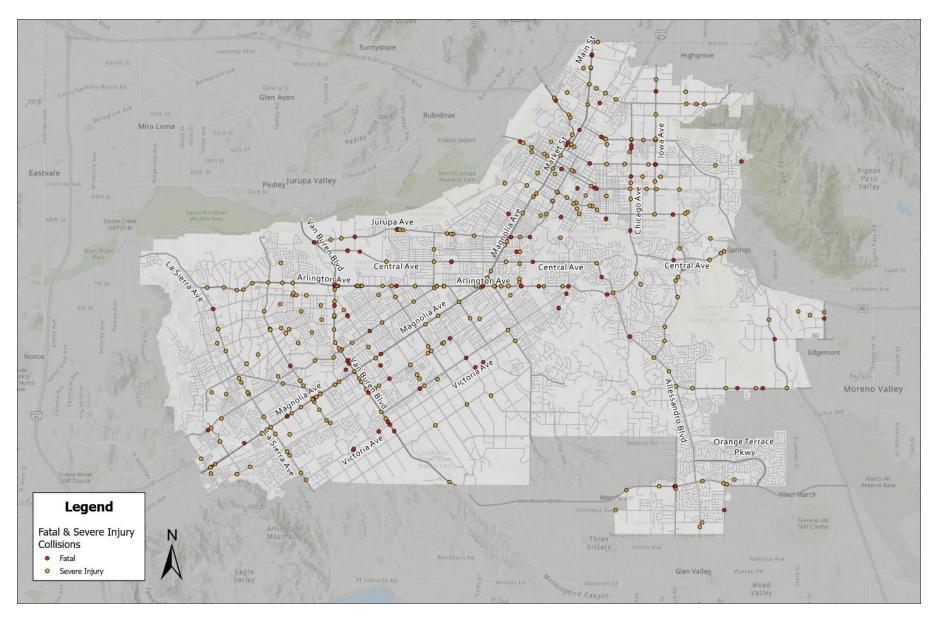

Figure 5 – All Collisions (2017-2022)

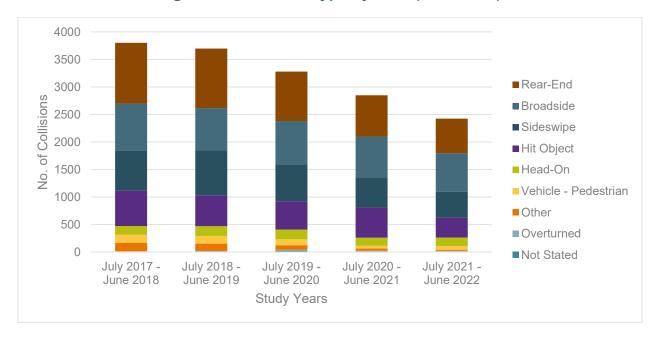

### 7. Crash Safety Trends

The analysis was conducted using a network screening process for the City-maintained roadway system based on collision records spanning from July 1, 2017 through June 30, 2022. This section contains the results of the analysis, which included the evaluation of Riverside's fatal and serious injury (generally denoted as K+SI) collisions, statewide K+SI collisions, pedestrian collisions, bicycle collisions, collision severity levels, and collision causes.

### 7.1 All Collisions

This report utilized collision data for a five-year period to provide a better understanding of trends and to reflect the patterns in crashes that have occurred on city streets. Data used for this report was extracted from Crossroads Software on July 5, 2022 and was current as of that date. Collision data from July 1, 2017, through June 30, 2022 as reported to Crossroads from the local enforcement indicated that during this time there were 16,081 collisions recorded within Riverside.

During this time, the most common occurring collision types were Rear-Ends (28%) and Broadsides (24%). The total number of collisions declined throughout the study period, with a decline in collisions with each ensuing year, as shown in **Figure 7**.

### Figure 7 – Collision Type by Year (2017-2022)

Source: Riverside Crossroads Database (2017-2022)

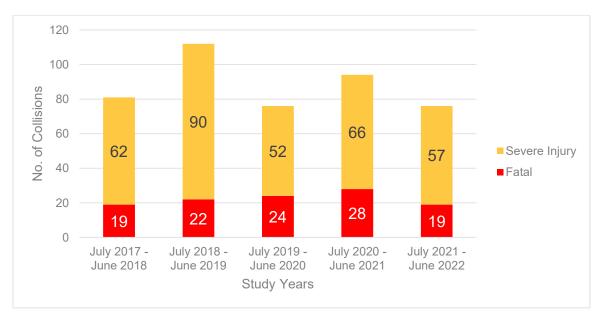

### 7.2 Fatalities & Severe Injuries

During the study period, 89 fatal collisions and 327 severe injury collisions occurred during the study period, as seen in **Figure 6.** This figure zoomed into each City ward is provided in Appendix A. **Table 3** outlines the fatal and severe injury collisions categorized by modes involved.

# Table 3 – Fatal and Severe Injury Collisions Categorized by Modes Involved (2017-2022)

| Involved With                      | # of Fatal Injury<br>Collisions | # of Severe<br>Collisions |
|------------------------------------|---------------------------------|---------------------------|
| Other Motor Vehicle                | 36                              | 144                       |
| Fixed Object                       | 23                              | 62                        |
| Pedestrian                         | 21                              | 62                        |
| Bicycle                            | 4                               | 25                        |
| Parked Motor Vehicle               | 1                               | 13                        |
| Other Object                       | 3                               | 8                         |
| Non - Collision                    | -                               | 8                         |
| Motor Vehicles on Other<br>Roadway | 1                               | 5                         |

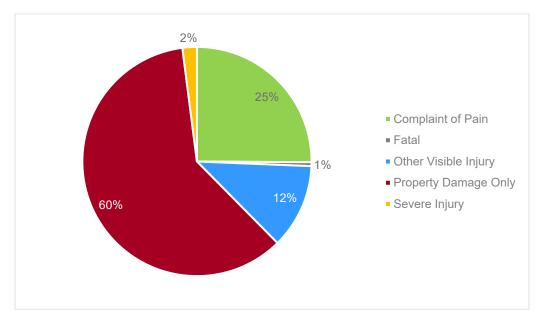

### Figure 8 – Fatal & Severe Injury Collisions (2017-2022)

### 7.3 Injury Levels

As shown in **Figure 9**, 60% of the collisions reported during the time-period resulted in property damage only. Fatalities and severe injuries totaled 3% of all collisions.

### Figure 9 – Collisions by Injury Levels (2017-2022)

Source: Riverside Crossroads Database (2017 – 2022)

### 7.4 Cause of Collision

The highest recorded cause of collisions in Riverside during this time period is Improper Turning at 28.3%, followed by Unsafe Speed at 19.2% and Other Improper Driving at 11.2%. Issues with Drivers Ignoring Traffic Signals and Signs also had a substantial impact on the City, comprising 10.4% of the collisions.

| Primary Collision Factor   | No. of Collisions | %      |
|----------------------------|-------------------|--------|
| Improper Turning           | 4500              | 28.32% |
| Unsafe Speed               | 3050              | 19.20% |
| Other Improper Driving     | 1777              | 11.19% |
| Traffic Signals and Signs  | 1656              | 10.42% |
| Auto R/W Violation         | 1591              | 10.02% |
| Driving Under Influence    | 1176              | 7.40%  |
| Unsafe Starting or Backing | 542               | 3.41%  |
| Unknown                    | 385               | 2.42%  |
| Wrong Side of Road         | 219               | 1.38%  |

### Table 4: - Cause of Collisions (2017-2022)

| Primary Collision Factor | No. of Collisions | %     |
|--------------------------|-------------------|-------|
| Pedestrian Violation     | 187               | 1.18% |
| Not Stated               | 169               | 1.06% |
| Other Than Driver        | 152               | 0.96% |
| Unsafe Lane Change       | 138               | 0.87% |
| Ped R/W Violation        | 130               | 0.82% |
| Improper Passing         | 79                | 0.50% |
| Other Hazardous Movement | 62                | 0.39% |
| Hazardous Parking        | 25                | 0.16% |
| Following Too Closely    | 21                | 0.13% |
| Impeding Traffic         | 8                 | 0.05% |
| Other Equipment          | 8                 | 0.05% |
| Other                    | 5                 | 0.03% |
| Lights                   | 3                 | 0.02% |
| Other Than Driver or PED | 1                 | 0.01% |
| Brakes                   | 1                 | 0.01% |

Source: Riverside Crossroads Database (2017 – 2022)

#### 7.5 Vulnerable Users

#### 7.5.1 Pedestrian Collisions

509 pedestrian involved collisions occurred during the study period, resulting in 21 fatal collisions, 62 severe injuries, and 369 collisions with some form of reported injury or pain. **Figure 10** shows the locations of pedestrian collisions during the study period. This figure zoomed into each City ward is provided in Appendix A. The top 3 primary collision factors for these collisions were pedestrian violation (36.6%), pedestrian right-of-way violation (25.5%), and other improper driving (16.9%).

#### 7.5.2 Bicycle Collisions

During the study period, 354 collisions involving bicycles were reported. Of these, 4 were fatal, 25 were severe injuries, and 277 were some forms of reported injury or pain. **Figure 10** shows the location of bicycle collisions during the study period. This figure zoomed into each City ward is provided in Appendix A. The top 3 primary collision factors for bicycle collisions were drivers/bicyclists on the wrong side of the road (29.7%), drivers/bicyclists ignoring traffic signals and signs (17.4%), and automobile right-of-way violations (14.7%).

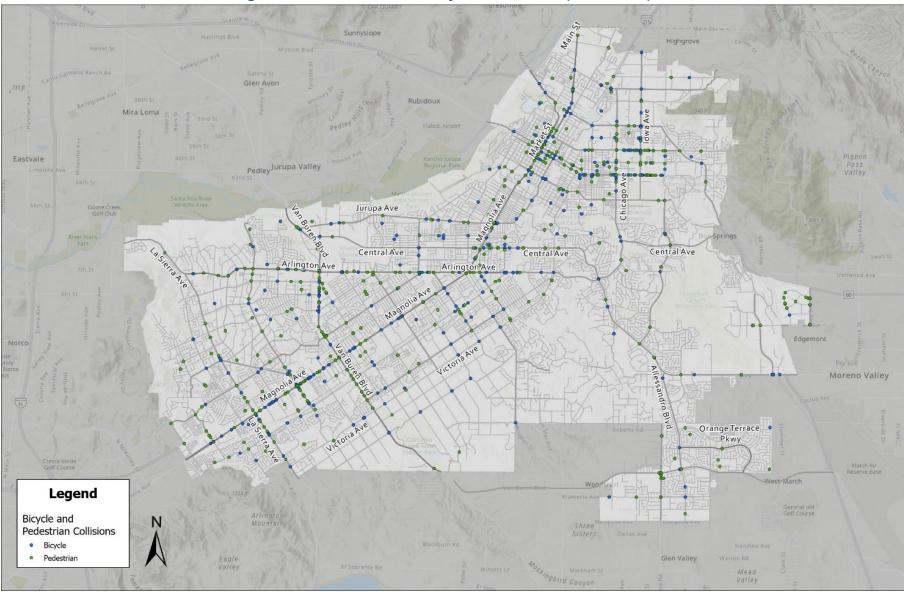

Figure 10 – Pedestrian & Bicycle Collisions (2017-2022)

#### 7.6 Nighttime Collisions

The following nighttime trends were observed:

- 38% of collisions occurred at night or during dusk/dawn hours.
- 4% of nighttime collisions involved pedestrians.
- 2% of nighttime collisions involved bicycles.

#### 7.7 Other Significant Trends

In addition, the following trends were observed:

- 27% of collisions occurred at night or during the dusk/dawn hours.
- Drivers aged 16-20 were at fault in 15.7% of all collisions.
- Drivers aged 65+ were at fault in 12.8% of all collisions.

#### 7.8 Statewide Comparison

A comparison of fatal & severe injury collision data to the State averages were conducted for data from 2016-2018 (the most recent statewide data available). These numbers may vary slightly from those mentioned previously, due to the differences in the years of the study period. The following are areas where Riverside's collision rates are higher or lower than those of the State. These numbers specifically compare the proportion of fatal and serious injury crashes that have the characteristics listed in **Table 5**.

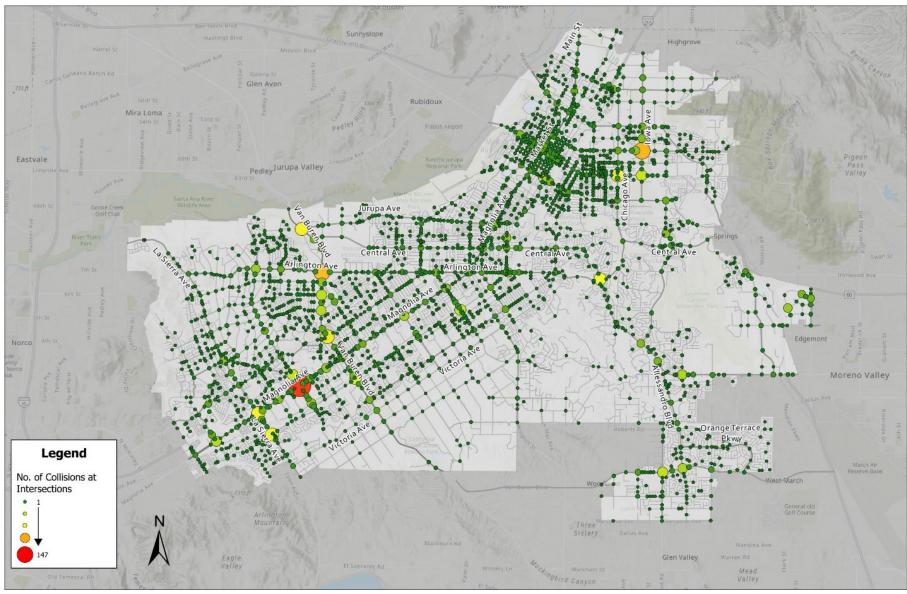

# Table 5: Comparison of Statewide and Riverside Fatal & Severe Injury Crashes(2016-2018)

|  | State                          | wide                                   |                                | Riverside                              |                       |

### 7.9 Collision Network Screening Analysis Results

**Figure 11** and **Figure 12** below show the results of the collision network screening analysis, with the number of collisions at both intersections and mid-block roadway segments. These figures zoomed into each City ward are provided in Appendix A.

#### Figure 11 – Collision Network Screening Analysis Results - Intersections (2017-2022)

Figure 12 - Collision Network Screening Analysis Results – Mid-block Collisions (2017-2022)

**Table 6 and 7** show the number of crashes occurring at the top 20 locations in Riverside by crash type for the locations that will be studied further in the Report, and highlights locations in which the probability of those crash types exceeding the threshold proportion is greater than 33%.

The tables are ordered by the number of collisions that occurred at that segment or intersection. To be statistically significant, only locations where more than two collisions occurred are represented. At locations with two or less collisions, random chance can account for crash history as much or more than specific roadway characteristics.

The tables are separated into sub-sections visible by the blue gradient. The first two columns, Collisions and CCR, represent the level of crash activity in absolute terms, and as relative to other similar locations, respectively.

Per guidance from the Local Roadway Safety Manual (LRSM) each sub-population of locations was ranked according to the number of collisions. The second column shows the CCR, which highlights whether or not the collision activity was higher or lower than the average for the sub-population based on the individual segment or intersection volume. This volume was either collected through data count resources or calculated based on the roadway classification. All averages used in the CCR calculation were established based on City of Riverside crash data to determine what locations might be best to prioritize at the local level. This process highlights locations of collisions that are unusual for the City to determine Riverside's challenge areas, and not problems faced by peer cities that do not apply in Riverside. The remaining columns total collisions by type, to evaluate each sub-population and understand what proportion of crashes in the City are of a particular type. The citywide proportion was compared with the local intersection or segment specific proportion to determine which locations have more of a given crash type than would be expected when considering the City average. A confidence level of 95% was used for the CCR Calculations. For this study, two categories of ranges were highlighted:

- Light Gray: >50% probability that this crash type is over-represented on this segment/intersection as compared to other characteristically similar locations within the City of Riverside. Although these locations have a slightly higher probability of this crash type than their counterparts, they are not necessarily highly significant.
- **Dark Gray:** >75% probability that this crash type is over-represented on this segment/intersection as compared to other characteristically similar locations within the City of Riverside. These locations are highly significant in regard to the number of collisions occurring here and should be further investigated.

After this analysis was completed, the locations were ranked against other similar locations within the City by their categories according to the expected proportion of that crash type within Riverside. Locations with higher-than-expected crashes of that type were identified by the probability that random chance would not account for exceedances.

Additionally, it should be noted that the columns for Collision Severity, Type, Involved With, and Behavior are additional characteristics of the collisions and should not be counted as a separate collision.

The following provides an example of how to read **Tables 6 and 7**.

Table Definitions:

- Total Collisions: Number of collisions observed at the intersection or segment from July of 2017 through June of 2022.
- Severity: The number of severe injury and fatal collisions that occurred at this location in the study period.
- Fatality: The number of fatal collisions that occurred at this location in the study period.
- Broadside, Sideswipe, Rear-End, Head-On, Hit Object, Overturned, Other, Pedestrian, Bicycle: The number of these types of collisions that occurred at this location in the study period.
- Other: The number of miscellaneous collision types (mostly single vehicle) that occurred at this location in the study period.
- Aggressive, Dark, Wet: The number of the collisions with this factor identified as the cause of collision.

#### Table 6– Analysis Results: Intersections (Top 20 Per Type)

### 8. Best Practices Evaluation and Emphasis Areas

#### 8.1 Best Practices Evaluation

**Table 8** identifies existing plans and policies that were recently completed, or are planned, or on-going within the City of Riverside. The intent of this review is to provide an idea of the types of strategies in place or encouraged by the City that may impact the safety analysis process. It will also identify opportunity areas where the City could adopt non-infrastructure countermeasures. This table also ties each topic and enhancement to the emphasis areas that are laid out in **Section 8.2**.

| Торіс   | Initiatives/ Current Status   | Opportunities for<br>Implementation or Enhancement   |  |  |  |  |  |
|---|---|--|--|--|--|--|--|
|   | COMMITTEES / ROLES  |  |  |  |  |  |  |
| Does the City have an<br>Active Transportation<br>Coordinator?                    | Yes, role is outlined in the Active<br>Transportation Plan (part of the<br>PACT)  | Continue Active Transportation<br>Coordinator role; Plan to maintain<br>the role through personnel<br>changes                                |  |  |  |  |  |
| Does the City have a<br>Safety or Active<br>Transportation Advisory<br>Committee? | City has a Transportation Board<br>Committee  | Continue to have board committee<br>meeting to discuss roadway and<br>transportation safety issues and<br>efforts                            |  |  |  |  |  |
| Does the City have an<br>Active Transportation<br>Safety Education<br>Program?    | Yes, the Riverside Police<br>Department (RPD) conducts a<br>monthly Bicycle and Pedestrian<br>Safety Operations training program<br>funded by California Office of<br>Traffic Safety. | Continue education efforts led by<br>RPD   |  |  |  |  |  |
|   | POLICY / PLANS  |  |  |  |  |  |  |
| Does the City have a<br>Complete Streets Plan?                                    | Yes, the City of Riverside PACT<br>includes a Complete Streets<br>Ordinance   | Regularly update Complete Streets<br>Ordinance; Continue to plan for<br>complete streets improvements as<br>part of regular planning process |  |  |  |  |  |
| Does the City assess<br>Traffic Impact Fees?                                      | City currently assesses impact<br>fees  | Continue to assess Traffic Impact<br>Fees and apply funding to<br>transportation improvements  |  |  |  |  |  |
| Does the City have a Safe<br>Routes to School<br>program?                         | No, however the City did apply and<br>implement SRTS grants, most<br>recently ATP Cycle VI  | Implement a Safe Routes to<br>School program with funding,<br>utilize collision analyses to refocus<br>efforts                               |  |  |  |  |  |
| Does the City implement<br>Traffic Calming Policies?                              | The City installs mini roundabouts,<br>bulbs, road diets, changes in road<br>texture  | Continue to implement traffic calming policies where necessary   |  |  |  |  |  |

#### Table 8 – Summary of Program, Policies, and Practices

|   |  | <u>ا</u>   |
|---|--|--|
| Does the City regularly conduct Speed Surveys?  | Yes, updated once every seven years.   | Continue to update as required by<br>California Vehicle Code; review   |
| Does the City utilized<br>Warrants for Stop Signs<br>and Signals?   | Yes  | Continue to utilize warrants for stop signs and signals  |
| Is the City planning for<br>Density and Walkable<br>Areas?  | Planned as part of Active<br>Transportation Plan (ATP). The<br>City has also recently adopted a<br>Housing Element.  | Continue to plan for walkable<br>areas; utilize collision analysis to<br>refocus efforts   |
| Does the City have<br>Transportation Demand<br>Management (TDM) or<br>Vehicle Miles Travelled<br>(VMT) Reduction<br>policies? | The City is working on a VMT<br>Mitigation program. However,<br>there are existing programs – RTA<br>Bus Pass Option, County of<br>Riverside VMT Mitigation options,<br>and CAPCOA 2021 Handbook.<br>The City requires developers to<br>meet VMT requirements outlined in<br>the TIA guidelines. | Continue to expand efforts to align<br>TDM and VMT reduction policies<br>with state guidelines   |
| Does the City perform<br>Traffic Crash Monitoring?  | Yes, the City has the CrossRoads<br>software and conducts Traffic<br>Crash Monitoring to address traffic<br>safety concerns from the public.<br>Spot monitoring is not a citywide<br>evaluation.   | Continue to utilize Crossroads<br>database for spot monitoring;<br>complete citywide monitor on<br>regular basis   |
| Does the City have an<br>Active Transportation<br>Master Plan?  | Yes, the City of Riverside PACT includes an Active Transportation Plan.  | Continue to implement Active<br>Transportation Plan  |
| Does the City have<br>CAMUTCD-compliant<br>Pedestrian Signal<br>Timing?   | Yes, all City traffic signals have<br>CAMUTCD-compliant pedestrian<br>signal timing.   | Continue to update pedestrian<br>signal timing as new standards are<br>developed. Explore the<br>implementation of bicycle signal<br>timing and bicycle detection at key<br>locations. |
| Does the City implement<br>Crosswalks at high<br>pedestrian locations?  | Yes  | Continue to implement these<br>improvements where feasible;<br>keep updated with best practices<br>regarding pedestrian<br>improvements  |
| What type of traffic<br>enforcement does the<br>City conduct?   | Speeding, stop violations, parking<br>violations, red light, failure to yield<br>to pedestrians, commercial vehicle<br>weight limit and axle restriction<br>violations, and other routine traffic<br>enforcement.  | Continue to enforce traffic laws at<br>key locations; Apply for OTS<br>funding to expand enforcement<br>activities   |
| What is the City's Bicycle<br>Policy?   | City has a Bicycle Master Plan and<br>Bicycle Program  | Continue to implement and update<br>Bicycle Master Plan and Program;<br>Utilize collision analysis to refocus<br>efforts if needed   |
| What types of transit does the City have?   | Riverside Transit Authority (bus),<br>Metrolink (rail)   | Identify areas of high transit usage<br>and focus collision analysis efforts<br>at these locations   |

- 56

| What types of wayfinding does the City have?  | City has traditional wayfinding signs  | Identify areas where wayfinding<br>can be expanded, including<br>pedestrian and destination<br>wayfinding  |
|---|--|--|
|   | DATA COLLECTION / INVENTO  | RY   |
| Does the City have an<br>Inventory of Pedestrian<br>Signs and Signals?                            | The City has an inventory of<br>signals, flashing beacons, and<br>HAWK signals. We have an<br>inventory of pedestrian signs.   | Continue to take inventory of these<br>signals as they are<br>updated/installed; Incorporate<br>inventory into GIS database  |
| Does the City have an<br>Inventory/Mapping of<br>Active Transportation<br>Routes?                 | Yes, we have a trail master plan in the PACT document.   | Continue to update inventory as<br>active transportation routes are<br>expanded; Incorporate into GIS<br>database  |
| Does the City utilize<br>Crossroads Database for<br>collisions?                                   | City utilizes Crossroads database  | Continue to utilize Crossroads database and regularly update   |
| Does the City have Active<br>Transportation Volume<br>Counting?                                   | We have traffic count data for spot<br>intersections that have been<br>counted and from traffic studies.   | Continue to update database of volumes; Incorporate into GIS database  |
|   | COORDINATION / FEEDBACI  | к  |
| What ways can citizens<br>give feedback about<br>roadway safety?                                  | Citizens can make requests online<br>or by calling 311.<br>Citizens give feedback via surveys,<br>emails, meetings, etc.   | Continue to expand ways that<br>citizens can give feedback.<br>Incorporate requests into GIS<br>maps to show hotspots for<br>requests.                                       |
| What types of<br>Coordination with other<br>City organization does<br>your department<br>perform? | Riverside Police Department,<br>Riverside Unified School District,<br>Riverside Public Utilities, Riverside<br>Fire Department, Riverside Parks<br>& Rec, Riverside Public Health,<br>Transportation Board | Continue to engage across<br>departments and organizations;<br>continue to involve these<br>organizations in collision analysis<br>and countermeasure development<br>process |
| What types of School<br>Engagement does the<br>City perform?                                      | City has quarterly meetings with<br>the school districts and UCR. City<br>has used OTS grant funding for<br>Safety Education events at<br>elementary schools.  | Continue school engagement processes   |
| What types of Law<br>Enforcement/Emergency<br>Service Engagement<br>does the City perform?        | The City has its own Police & Fire<br>Departments. Staff member from<br>RPD coordinates safety outreach<br>programs  | Continue to engage law<br>enforcement and fire department in<br>roadway safety planning  |

UITE

#### 8.2 Emphasis Areas

Emphasis areas represent crash factors that are common in the City and provide the opportunity to reduce the largest number of traffic injuries with strategic investment. Emphasis areas were developed by revisiting the vision and goals of this planning process and comparing them with the trends and patterns identified in the crash analysis.

#### 8.2.4 Emphasis Area #1: Vulnerable Road Users (Pedestrians & Bicyclists)

**Description**: Pedestrians and bicyclists are classified by Caltrans as vulnerable users, meaning they possess the highest potential for severe harm during a crash. This emphasis area is inclusive of wheelchairs and those on scooters and skateboards. These groups need appropriate infrastructure to travel to key destinations such as schools, workplaces, and core commercial areas. Of the 863 crashes involving vulnerable road users, 25 resulted in a fatal injury and 87 resulted in a severe injury. The City should aim to implement countermeasures to further protect these users from injury.

#### Goals for Emphasis Area #1:

- Improve active transportation infrastructure by adding pedestrian facilities, bike lanes, and other amenities to make it safer for employees and community members to get to key destinations such as school, commercial centers, transit centers, and recreation areas
- Encourage healthier lifestyles through active transportation infrastructure
- Apply for HSIP, ATP, SS4A, and other funding to implement countermeasures to address vulnerable road user crashes

#### Strategies for Emphasis Area #1:

- Provide outreach, education, and enforcement to encourage more separation between vehicular and pedestrian traffic
- Install high-visibility crosswalk markings at the intersection of key destinations
- Ensure all signalized intersections have completed crosswalks
- Provide dedicated pedestrian and bicycle infrastructure to and from bus stops
- Install adequate street lighting and increase lighting levels in conflict areas
- Widen street shoulders
- Provide signage (e.g., pedestrian crossing ahead) to help drivers expect to slow down for pedestrians and bikes
- Install bicycle lanes along key corridors
- Install bicycle storage facilities in public areas, such as parks and schools, to encourage bicycle use
- Install bicycle markings (including green paint in conflict zones)
- Install bicycle detection with discrimination capability on key corridors

# CITY OF RIVERSIDE

- Install curb extensions
- Install ADA ramps
- Modify signal phasing to implement a Leading Pedestrian Interval (LPI)
- Install/upgrade pedestrian crossing at uncontrolled locations
- Install audible pedestrian push button systems at signalized intersections
- Establish rotating enforcement targets for high visibility campaigns
- Work closer with local advocacy groups and bicycle clubs (such as the Inland Empire Biking Alliance and Riverside Bicycle Club) to assist in prioritizing bicycle improvements
- Work with rail operators to improve safety at rail crossings

These strategies will be implemented by the City, law enforcement, and community organizations. Funding sources for these strategies may include OTS, NHTSA, and SB1 grant programs.

#### 8.2.1 Emphasis Area #2: Impaired Driving

**Description:** Impaired driving crashes are a high priority challenge area within the Caltrans SHSP. Caltrans defines these as crashes where any evidence of drug or alcohol use by the driver is present, even if the driver was not over the legal limit. 7.4% were reported as the driver being under the influence of alcohol or drugs. 6.74% of all fatalities and 14.07% of all severe injuries were attributable to impaired driving.

#### Goal for Emphasis Area #2:

- Reduce the number of crashes attributed to impaired driving
- Identify hot spots and priority corridors for countermeasures to reduce impaired driving
- Apply for funding to implement countermeasures to reduce impaired driving crashes

#### Strategies for Emphasis Area #2:

- Authorize, publicize, and conduct sobriety checkpoints programs
- Implement an impaired driving education campaign
- Develop educational programs targeting specific audiences based on age group
- Additional enforcement presence
- Create effective media campaigns in both visual and print media

These strategies will be implemented by the City, law enforcement, and community organizations. Funding sources for these strategies may include OTS, NHTSA, and SB1 grant programs.

# CITY OF RIVERSIDE

#### 8.2.2 Emphasis Area #3: Intersection Improvements

**Description:** Collisions involved at intersections, interchanges, and other roadway access. About 82% of total of collisions took place at or near intersections. 12.1% of the fatal and severe injury collisions in Riverside took place at or near intersections, compared to 23.8% statewide.

#### Goal for Emphasis Area #3:

- Reduce the number of crashes at intersections, interchanges, and other roadway access.
- Identify hot spots and prioritize locations for intersection improvements.
- Apply for funding and implement countermeasures to address collisions at intersections for improvement.

#### Strategies for Emphasis Area #3:

- Engineering improvements are not limited but could include:
  - o backplates with reflective borders
  - o left-and right turn lanes at two-way controlled intersections
  - o protected left-turn movements
  - battery back-up systems
  - o intersection safety lighting
  - o high visibility crosswalks
- Collaborate with Caltrans to prioritize safety at interchanges and promote walking and bicycling

These strategies can be implemented by the City with assistance from emergency services and community organizations. Funding sources for these strategies may include HSIP, OTS, and SB1 grant programs.

#### 8.2.3 Emphasis Area #4: Aggressive Driving

**Description:** Aggressive driving, as defined by the Caltrans SHSP, includes several behaviors including speeding, tailgating, and ignoring traffic signals and signs. Aggressive driving behaviors (unsafe speed or following too closely) accounted for 30 percent of collisions. 16 percent of these collisions resulted in a fatality, 28 percent of these collisions resulted in a severe injury, and 9 percent of these collisions resulted in some other form of injury.

#### Goal for Emphasis Area #4:

- Reduce the number of crashes due to aggressive driving in the City
- Identify hot spots and priority corridors for aggressive driving
- Apply for funding and implement countermeasures to address aggressive driving

#### Strategies for Emphasis Area #4:

• Educational campaign to target aggressive drivers

- Increased law enforcement presence near aggressive driving hotspots
- Increased coordination with law enforcement and other community organizations
- Engineering strategies such as:
  - Dynamic speed feedback signs
  - Temporary speed radar trailers

These strategies will be implemented by the City, while partnering with Caltrans, Southern California Association of Governments (SCAG), California Highway Patrol (CHP), and other community partners. Funding sources for these strategies may include HSIP, Active Transportation Program (ATP), OTS, SB 1, and SS4A grant programs.

#### 9. Countermeasure Toolbox

This section provides information on general identified issues, crash reduction factors, improvements, and countermeasures identified for the City of Riverside, as well as for specific project locations identified as part of this analysis. Countermeasures for each of the Safety Project Case Studies are based on data analysis, stakeholder input, and site visits.

#### **9.1 Infrastructure Improvements**

#### 9.1.1 Countermeasure Selection Process

Part D of the HSM provides information on Crash Modification Factors (CMF) for roadway segments, intersections, interchanges, special facilities, and road networks. CMFs are used to estimate the safety effects of highway improvements, specifically to compare and select highway safety improvements. A CMF less than 1.0 indicates that a treatment has the potential to reduce crashes. A CMF greater than 1.0 indicates that a treatment has the potential to increase crashes. A Crash Reduction Factor (CRF) is directly connected to the CMF and is "mathematically defined as (1 – CMF) (the higher the CRF, the greater the expected reduction in crashes)<sup>5</sup>." CMFs can help decision makers weigh potential alternative projects, but are only one measure of a project's value and should be considered part of a larger decision making process. Furthermore, it is important to note that not all CMFs are as reliable as others. The FHWA maintains a federal depository of CMFs and includes a star rating system to help users determine which CMFs are bolstered by the best and most thorough research. Key factors to consider when applying CMFs include:

- **1.** Selection of an appropriate CMF;
- 2. Estimation of crashes without treatment;
- 3. Application of CMFs by type and severity; and,
- 4. Estimation of the combined effect for multiple treatments.

Examples of Safety Countermeasures can be found through several sources. This Report utilizes the countermeasures found in the California LRSM and the CMF Clearinghouse (CMF CH) website. Countermeasures for each of the Safety Project Case Studies are based on the data analysis and site visits. Additional countermeasures were identified for the high-level issues on a city-wide level and are discussed in **Section 9.2**.

<sup>&</sup>lt;sup>5</sup> Local Roadway Safety Manual (Version 1.6) 2022. Page 27.

# CITY OF RIVERSIDE

#### 9.1.2 Safety Project Case Studies

From the city-wide analysis, twelve (12) project case study locations were selected for further evaluation and countermeasure development. For each of these locations, Safety Project Case Studies were developed to provide a balanced understanding of common safety patterns at a variety of location types that can be used to associate countermeasures with specific roadway configurations and conditions. These locations were identified through the analysis process based on their crash histories, stakeholder engagement, the observed crash patterns, and their different characteristics to provide the most insight into potential systemic safety countermeasures that the City can employ to achieve the most cost-effective safety benefits.

A Safety Project Case Study was developed for each of the following locations:

- 1. Signalized Intersection: Market St & 6<sup>th</sup> St
- 2. Roadway Segment: Mission Inn Ave Redwood Dr to Bridge
- 3. Roadway Segment: Main St Spruce St to Poplar St
- 4. Signalized Intersection: 14<sup>th</sup> St & Olivewood Ave
- 5. Unsignalized Intersection: Victoria Ave & Lincoln Ave
- 6. Unsignalized Intersection: Washington St & Lincoln Ave
- 7. Signalized Intersection: Van Buren Boulevard & Wood Rd
- 8. Unsignalized Intersection: Tyler St & Hemet St
- 9. Signalized Intersection: Tyler St & Magnolia Ave
- **10.** Signalized Intersection: Van Buren Blvd & Arlington Ave
- 11. Signalized Intersection: Van Buren Blvd & Jurupa Ave
- 12. Roadway Segment: Central Ave Fremont St to Wilderness Ave

The following pages summarize conditions at each location, and potentially beneficial countermeasures. Countermeasures were subjected to a benefit/cost assessment and scored according to their potential return on investment. These case studies can be used to select the most appropriate countermeasure, and to potentially phase improvements over the longer-term. The potential benefit of these countermeasures at locations with similar design characteristics can then be extrapolated regardless of crash history, allowing for proactive safety enhancements that can prevent future safety challenges from developing. These case study sheets can also be used to position the City for future grant funding opportunities. The monetary benefits are calculated from the latest Caltrans injury level cost data<sup>6</sup>. Fatal and severe injury collisions are estimated at \$2.46 million, Other Visible Injury collisions at \$159,900, Complaint of Pain collision at \$90,900, and Property Damage Only collisions at \$14,900.

| Potential<br>Countermeasures               | Crash Reduction<br>Factor<br>(LRSM/CMF ID) | 20 Year Safety<br>Benefit | Total 20-Year Costs | Safety Related B/C<br>Ratio |
|--|--|---------------------------|---------------------|-----------------------------|
| Install raised median                      | 25%<br>(R08)                               | \$597,925                 | \$2,563,200         | 0.23                        |
| Install chevron signs on horizontal curves | 40%<br>(R23)                               | \$956,680                 | \$14,400            | 66.44                       |
| Install curve advance<br>warning signs     | 25%<br>(R24)                               | \$597,925                 | \$4,800             | 124.57                      |

## Countermeasure Evaluation (continued)

| Potential<br>Countermeasures                                  | Crash Reduction<br>Factor<br>(LRSM/CMF ID) | 20 Year Safety<br>Benefit | Total 20-Year Costs | Safety Related B/C<br>Ratio |
|---|--|---------------------------|---------------------|-----------------------------|
| Install curve advance<br>warning signs<br>(flashing beacon)   | 30%<br>(R25)                               | \$717,510                 | \$24,000            | 29.90                       |
| Install<br>dynamic/variable<br>speed warning signs            | 30%<br>(R26)                               | \$717,510                 | \$45,600            | 15.73                       |
| Install Separated<br>Bike Lanes along<br>Central Ave corridor | 45%<br>(R33PB)                             | \$985,500                 | \$51,240            | 19.23                       |
| Install High Friction<br>Surface Treatment                    | 55%<br>(R21)                               | \$1,315,435               | \$733,326           | 1.79                        |

#### 9.2 City-wide Countermeasure Toolbox

This evaluation considered citywide trends to identify countermeasures that would likely provide the most benefit with widespread implementation. **Table 9** outlines the citywide safety project opportunities, which is also referred to as the "Countermeasure Toolbox". Within the toolbox, the description of the countermeasure along with its Local Roadway Safety Manual (LRSM) ID number is listed. The next column, Crash Reduction Factor (CRF), are "multiplicative factors used to estimate the expected reduction in number of crashes after implementing a given countermeasure at a specific site (the higher the CRF, the greater the expected reduction in crashes)." For each of these countermeasures, a planning level benefit/cost analysis was completed.

Applying the benefit/cost at the citywide level was estimated assuming some randomness in crash distribution. The location characteristics, such as whether there is a traffic signal, and the type of crashes, were used at the citywide level to calculate an average cost of crashes that the countermeasure might reduce. The benefit per location was then factored out to a 20-year lifecycle savings, with an Opinion of Project Probable Cost (OPCC) for the initial installation costs and a per-year maintenance cost estimate. The cost shown in **Table 9** should be considered initial planning costs using 2022 dollars and not assumed final.

## CITY OF RIVERSIDE LOCAL ROADWAY SAFETY PLAN

#### Table 9 - Citywide Safety Countermeasure Toolbox

| ID                 | Potential Countermeasures   | Where to apply?   | Crash<br>Reduction<br>Factor | Per Unit<br>Cost | Unit             |
|--------------------|---|---|------------------------------|------------------|------------------|
| S02                | Improve signal hardware; lenses, back-plates                                | Signalized intersections with significant broadside   | 15%                          | \$26,400         | per intersection |
|                    | with retroreflective borders, mounting, size, and number                    | and rear-end collisions due to signal visibility  |                              |                  |                  |
| S04                | Provide Advanced Dilemma Zone Detection                                     | Signalized intersections with significant right-angle   | 40%                          | \$76,800         | per intersection |
|                    | system  | and rear-end collisions due to unsafe stopping  |                              |                  |                  |
|                    |   | during yellow phases  |                              |                  |                  |
| S10                | Install flashing beacons as advance warning for<br>signalized intersections | Locations with sight distance issues  | 30%                          | \$10,200         | per beacon       |
| S17PB <sup>7</sup> | Install audible pedestrian push button systems                              | Signalized intersections with crosswalks  | 25%                          | \$11,000         | Per intersection |
| S18PB              | Install high visibility crosswalk for signalized intersections              | Signalized intersections with no marked crossing<br>and pedestrian heads, with significant turning<br>movements | 25%                          | \$74,400         | per intersection |
| S21PB              | Modify signal phasing to implement a Leading<br>Pedestrian Interval (LPI)   | Signalized Intersections – especially those with<br>high pedestrian activity                                    | 60%                          | \$45,600         | per intersection |
| NS03               | Install signals   | Unsignalized intersections with significant collision activity where warrants are met                           | 30%                          | \$378,000        | per intersection |
| NS05mr             | Convert intersection to mini-roundabout                                     | Intersections with lower vehicle speeds, with<br>posted speed limits of 30 mph or less                          | 30%                          | \$100,000        | per location     |
| NS06               | Install/upgrade larger or additional stop signs or                          | Unsignalized intersections with crash history   | 15%                          | \$8,400          | per sign         |
|                    | other intersection warning/regulatory signs                                 | showing running stop signs  | 1570                         | ψ0,+00           | her sign         |
| NS08               | Install Flashing Beacons at Stop-Controlled<br>Intersections (LED edge lit) | Unsignalized intersections with crash history showing running stop signs  | 15%                          | \$12,000         | per beacon       |

<sup>7</sup> This countermeasure typically covers pedestrian countdown signal heads, but can be also used for audible pedestrian push buttons

## CITY OF RIVERSIDE LOCAL ROADWAY SAFETY PLAN

| ID     | Potential Countermeasures  | Where to apply?  | Crash<br>Reduction<br>Factor | Per Unit<br>Cost | Unit             |
|--------|--|--|------------------------------|------------------|------------------|
| NS14   | Install raised median on approaches for<br>unsignalized intersections                  | Unsignalized intersections where related or<br>nearby turning movements affect the safety and<br>operation of an intersection  | 25%                          | \$1,068          | per LF           |
| NS20PB | Install pedestrian crossing at uncontrolled locations (new signs and markings only)    | Unsignalized intersections with high pedestrian activity where sufficient sight distance is available  | 25%                          | \$34,800         | per intersection |
| NS22PB | Install Rectangular Rapid Flashing Beacon<br>(RRFB)                                    | Unsignalized intersections and mid-block pedestrian crossings  | 35%                          | \$30,000         | Per location     |
| R08    | Install raised median  | Locations with a high number of head-on collisions   | 25%                          | \$1,068          | per LF           |
| R14    | Road Diet (Reduce travel lanes from 4 to 4 and add a two-way left-turn and bike lanes) | Roadway segments with high number of sideswipe collisions  | 30%                          | \$79,200         | per mile         |
| R23    | Install chevron signs on horizontal curves   | Roadway segments that have a significant amount of collision activity at sharp curves.   | 40%                          | \$2,400          | per sign         |
| R24    | Install curve advance warning signs  | Roadway segments that have a significant amount of collision activity at sharp curves.   | 25%                          | \$2,400          | per sign         |
| R25    | Install curve advance warning signs (flashing beacon)                                  | Roadway segments that have a significant amount of collision activity at sharp curves.   | 30%                          | \$12,000         | per beacon       |
| R26    | Install dynamic/variable speed warning signs   | Roadway segments with a significant number of collisions due to unsafe speeds.   | 30%                          | \$22,800         | per sign         |
| R28    | Install edge-lines and centerlines   | Roadway segments with collisions that resulted in run-off-road right/left, head-on, or opposite-<br>direction-sideswipe.   | 25%                          | \$100,800        | per mile         |
| R32PB  | Install bike lanes   | Locations with a high number of bicycle collisions   | 35%                          | \$76,800         | per mile         |
| R33PB  | Install Separated Bike Lanes   | Locations with a high number of bicycle collisions<br>and/or high bicycle traffic volumes, where<br>sufficient space is available for the selected<br>separation measure | 45%                          | \$120,000        | per mile         |

## CITY OF RIVERSIDE LOCAL ROADWAY SAFETY PLAN

| ID  | Potential Countermeasures                                       | Where to apply?   | Crash<br>Reduction<br>Factor | Per Unit<br>Cost | Unit            |
|-----|---|---|------------------------------|------------------|-----------------|
| R21 | Improve Pavement Friction (High Friction<br>Surface Treatments) | Areas where there are significant crashes or<br>skidding, and areas near curves, loop rams,<br>intersections, and areas with short stopping or<br>weaving distances | 55%                          | \$33             | Per square yard |
| _*  | Refresh lane guidance markings                                  | Locations with faded lane guidance<br>markings/striping   | 5%                           | \$6,000          | per location    |
| -*  | Install curb extensions   | Intersections with high pedestrian activity   | 5%                           | \$20,000         | per extension   |

\*The City is not limited to the countermeasures in this toolbox and can utilize other approved countermeasures in its roadway safety planning.

### **10. Funding Sources & Next Steps**

#### **10.1 Funding Sources**

Competitive funding resources are available to assist in the development and implementation of safety projects in Riverside. The City should continue to seek available funding and grant opportunities from local, state, and federal resources to accelerate their ability to implement safety improvements throughout Riverside. This section provides a high-level introduction to some of the main funding programs and grants for which the City can apply.

#### 10.1.1 Highway Safety Improvement Program

The Highway Safety Improvement Program (HSIP) is a Federal program that apportions funding as a lump sum for each state, which is then divided among apportioned programs. These flexible funds can be used for projects to preserve or improve safety conditions and performance on any Federal-aid highway, bridge projects on any public road, facilities for non-motorized transportation, and other project types. Safety improvement projects eligible for this funding include:

- New or upgraded traffic signals
- Upgraded guard rails
- Pedestrian warning flashing beacons
- Marked crosswalks
- Other projects listed in the Caltrans Local Road Safety Manual

California's local HSIP focuses on infrastructure projects with national recognized crash reduction factors. Normally HSIP call-for-projects is made at an interval of one to two years. The applicant must be a city, a county, or a tribal government federally recognized within the State of California.

Additional information regarding this program at the Federal level can be found online at: <u>https://safety.fhwa.dot.gov/hsip/</u>. California specific HSIP information – including dates for upcoming call for projects - can be found at: <u>http://www.dot.ca.gov/hq/LocalPrograms/hsip.html</u>. HSIP Cycle 11 applications are due in September 2022.

#### **10.1.2 Caltrans Active Transportation Program**

Caltrans Active Transportation Program (ATP) is a statewide funding program, created in 2013, consolidating several federal and state programs. The ATP funds projects that encourage increased mode share for walking and bicycling, improve mobility and safety for non-motorized users, enhance public health, and decrease greenhouse gas emissions. Projects eligible for this funding include:

- Bicycle and pedestrian infrastructure projects
- Bicycle and pedestrian planning projects (e.g., safe routes to school)
- Non-infrastructure programs (education and enforcement)

This program funding is provided annually. The ATP call for projects typically comes out in the spring. Information on this program and cycles can be found online at: <a href="http://www.dot.ca.gov/hq/LocalPrograms/atp/">http://www.dot.ca.gov/hq/LocalPrograms/atp/</a>.

#### 10.1.3 California SB 1

The California SB 1 is a landmark transportation investment to rebuild California by fixing neighborhood streets, freeways, and bridges in communities across California and targeting funds toward transit and congested trade and commute corridor improvements.

California's state-maintained transportation infrastructure will receive roughly half of SB 1 revenue: \$26 billion. The other half will go to local roads, transit agencies and an expansion of the state's growing network of pedestrian and cycle routes. Each year, this new funding will be used to tackle deferred maintenance needs both on the state highway system and the local road system, including:

- Local Street and Road Maintenance and Rehabilitation: \$1.5 billion
  - This funding is dedicated to improve local road maintenance, rehabilitation, and/or safety through projects such as restriping and repaving.
- Bike and Pedestrian Projects: \$100 million
  - This will go to cities, counties, and regional transportation agencies to build or convert more bike paths, crosswalks, and sidewalks. It is a significant increase in funding for these projects through the ATP.
- Local Planning Grants: \$25 million

#### 10.1.4 California Office of Traffic Safety Grants

This program has funding for projects related to traffic safety, including transportation safety education and encouragement activities. Grants applications must be supported by local crash data (such as the data analyzed in this report) and must relate to the following priority program areas:

- Alcohol Impaired Driving
- Distracted Driving
- Drug-Impaired Emergency Medical Services
- Motorcycle Safety
- Occupant Protection
- Pedestrian and Bicycle Safety
- Police Traffic Services
- Public Relations, Advertising, and Marketing Program
- Roadway Safety and Traffic Records

#### **10.1.5 SCAG Sustainable Communities Program**

This program is an innovative vehicle for promoting local jurisdictional efforts to test local planning tools. The Sustainable Communities Program (SCP) provides direct technical assistance to SCAG member jurisdictions to complete planning and policy efforts to implement the regional Sustainable Communities Strategies (SCS). Grants are available in the following three categories:

- Integrated Land Use
  - Sustainable Land Use Planning
  - Transit Oriented Development (TOD)
  - Land Use & Transportation Integration
- Active Transportation
  - o Bicycle Planning
  - Pedestrian Planning
  - Safe Routes to School Plans
- Green Region
  - Natural Resource Plans
  - Climate Action Plans (CAPs)
  - Green House Gas (GHG) Reduction programs

#### 10.1.6 Safe Streets and Roads for All (SS4A) Grant Program

This program has allocated \$1B annually for the next 5 years for local cities, counties, MPOs, and other roadway owners (excepting state DOTs) for safety improvement grants for safety planning, education, enforcement, and roadway improvements. This program is not benefit / cost based. Evaluation criteria are oriented to the project's alignment with the Safe Systems approach. There is a 20% local match requirement (can be in-kind contribution via staff billable hours). Planning grants are open to any eligible agency and Implementation grants are open to agencies with a completed safety plan such as a Local Roadway Safety Plan. Planning grants are expected to range from \$100K to \$1M and Implementation grants are expected to range from \$1M to \$20M. Grant applications are due in September 2022.

#### **10.1.7 Infrastructure Investment and Jobs Act**

In November 2021, the President signed into law the \$1.2 trillion Infrastructure Investment and Jobs Act. In addition to the SS4A grant program described above, this law provides billions of dollars in additional funding for improvements and investment in the transportation sector nationwide. The law provides \$30 billion in funding over 5 years for competitive RAISE grants for transportation projects, as well as additional funding for repair and environmental mitigation projects. As these grant programs continue to be developed, City can position itself by identifying potential projects and programs to pursue.

#### **10.2 Implementation Plan**

Once the Local Roadway Safety Plan has been completed, the City can plan to regularly review and monitor collision data for trends and changes. The City can also plan to prioritize and implement certain improvements that were identified in this plan.

#### 10.2.1 Monitoring

The City can plan to regularly monitor the success of the LRSP and its related implementations by performing the following steps. This before and after analysis can be performed every second year. The City can also meet with the Sheriff department quarterly to discuss roadway safety issues and compare to the latest collision analysis.

- Pull yearly collision data from Crossroads database to determine year-over-year trend
- Utilize Crossroads or GIS software to review the number of collisions occurring at specific locations. Locations where improvements have been made should receive priority for monitoring.
- Based upon changes in collision activity, determine efficacy of improvements and adjust strategies going forward

#### 10.2.2 Analysis Update

The City can plan to update the analysis every two years as part of a monitoring program, as described in **Section 10.2.1**. Every 4 years the City will perform a major update to the analysis and the Local Roadway Safety Plan by performing the following steps. This update will maintain eligibility for the HSIP grant funding for the City. This analysis should continue to focus on both systemic and location-specific safety needs.

- 1. Obtain updated Statewide Integrated Traffic Records System (SWITRS) collision data from the Crossroads database
- 2. Use Excel software to update the collision trend analysis completed in Section 7, continue to compare new collision to historic trends
- 3. Update the roadway shapefile with any new or upgraded roadways
- 4. Update the intersection shapefile with any new or upgraded intersections
- Re-run the GIS collision tool to determine the number of collisions at intersections and roadways within the updated study period. The City can plan to run the collision tool for all collisions, as well as the collision types identified in Section 3.2.2.
- 6. Update the collision analysis performed in this report, including the collision analysis tables shown in **Section 7.7.**
- **7.** Review the Collision Toolbox to determine if any additional countermeasures should be considered for implementation in the City

#### **10.2.3 Implementation Strategies**

The opportunities identified in this report provide systemic and location-specific countermeasures that can be implemented within the City. Implementation will be dictated by funding and available resources, this

guidance is preliminary and subject to change. Over the near-term and mid-term, the City can concentrate its efforts on the following emphasis areas.

- Vulnerable Road Users (Pedestrians and Bicyclists)
- Aggressive Driving
- Impaired Driving
- Intersection Improvements

Analysis conducted at the citywide level indicated that these factors were some of the most frequent influences contributing to collisions within the City. The countermeasure opportunities previously discussed in this report for both systemic and project-specific improvements can be used as a basis for developing projects at locations where addressing these focus areas would be of the most benefit. Projects that address these focused areas citywide can be developed with a high benefit-to-cost ratio (by applying City-wide collision rates), allowing competitive projects to be developed even at sites with little to no direct collision history, but with conditions that might contribute to future collisions. For location-specific improvements, the City can utilize benefit-cost ratio calculations to help prioritize projects as funding and resources become available. The countermeasure toolbox in **Table 8** also identified a potential prioritization timeline for each improvement, based on cost, effectiveness and feasibility.

This project prioritization process will help the City be ready for the funding opportunities identified in **Section 10.1**. Project prioritization will also help to guide the projects as they are taking into the design and construction project. Coordination with City departments will be key in the completion of these implementations.

The City can also plan to implement the non-engineering improvements identified throughout this report, including actions related to Enforcement, Education, and Emergency Services. These actions will require coordination with internal and external stakeholders, such as City departments, law enforcement, local government organizations, and local community organizations. Early buy-in and engagement from these stakeholders will be key to the success of these actions.

To aid in these actions, the City can assemble a 'Task Force' of representatives from different City departments, such as Public Works, Development Services, and Public Safety. This task force will be instrumental in the monitoring, analysis update, project development and project implementation outlined in this plan.

#### 10.3 Next Steps

The City has completed this LRSP to guide the process of future transportation safety improvements for years to come. In addition to the actions identified in the Implementation Plan, the City can perform the following to guide the success of this LRSP and the safety efforts overall.

- Develop investment program to help achieve the City's Vision Zero goals
- Work with state and partner agencies on implementation of large-scale programs and policies
- Incorporate safety analysis findings in future updates of safety programs
- Monitor statewide safety priorities, guidance, and funding opportunities
