

Preliminary Hydrology and Hydraulics for Overlook Parkway Bridge

Preliminary hydrology calculations were performed to determine the existing flow-rate (cubic feet per second) to analyze the existing Alessandro Arroyo as it flows under the proposed Overlook Bridge. USGS topography was utilized to determine the tributary area to the crossing. A current aerial image, along with the city of Riverside land use plan was used to determine the cover type and land use. See Appendix A for the Drainage Area maps.

A Synthetic Unit Hydrograph was performed to determine a peak flow rate. Based on the analysis, the exiting flow-rate is 2,472 cfs. See Appendix B for the Synthetic Unit Hydrograph calculations and results.

Preliminary Hydraulics for the bridge crossing (**Option B**) was performed for the pre-project (natural arroyo) and post-project (arroyo with pier and bridge abutments) conditions. WSPG CIVILDESIGN software was used to analyze the arroyo and impacts from the bridge. For the pre-project condition the arroyo was analyzed in its current natural condition. For the post-project condition, the arroyo was analyzed with the bridge abutments on the south and north side with an 8-foot diameter pier assumed at the middle of the arroyo section. Preliminary cross sections of the creek were used based on the available existing topography of the area. The cross sections were input into the WSPG CIVILDESIGN software with the calculated flow rate to determine preliminary impacts to the arroyo. See Appendix C for the WSPGW calculations and exhibit.

The result from the preliminary hydrology/hydraulics study determined that no adverse effects occur downstream of the proposed bridge location. However, the water surface increases upstream by approximately 9.5 inches or 0.8 feet. The water surface elevation is disturbed for approximately 100 feet upstream from the bridge crossing. The upstream velocities are slightly reduced by an average of 0.25 feet per second.

During Construction the use of Best Management Practices (BMP's) will be used to minimize the water quality impacts during construction. The long term water quality mitigation will be achieved by providing water quality inlet filter at the low point catch basins. The catch basins will be designed to connect into the existing storm drain and headwall system located west of Via Vista Drive and Overlook Parkway.

The following attachments are included:

Appendix A:

- Drainage Area with USGS Map
- Drainage Area with Aerial photograph

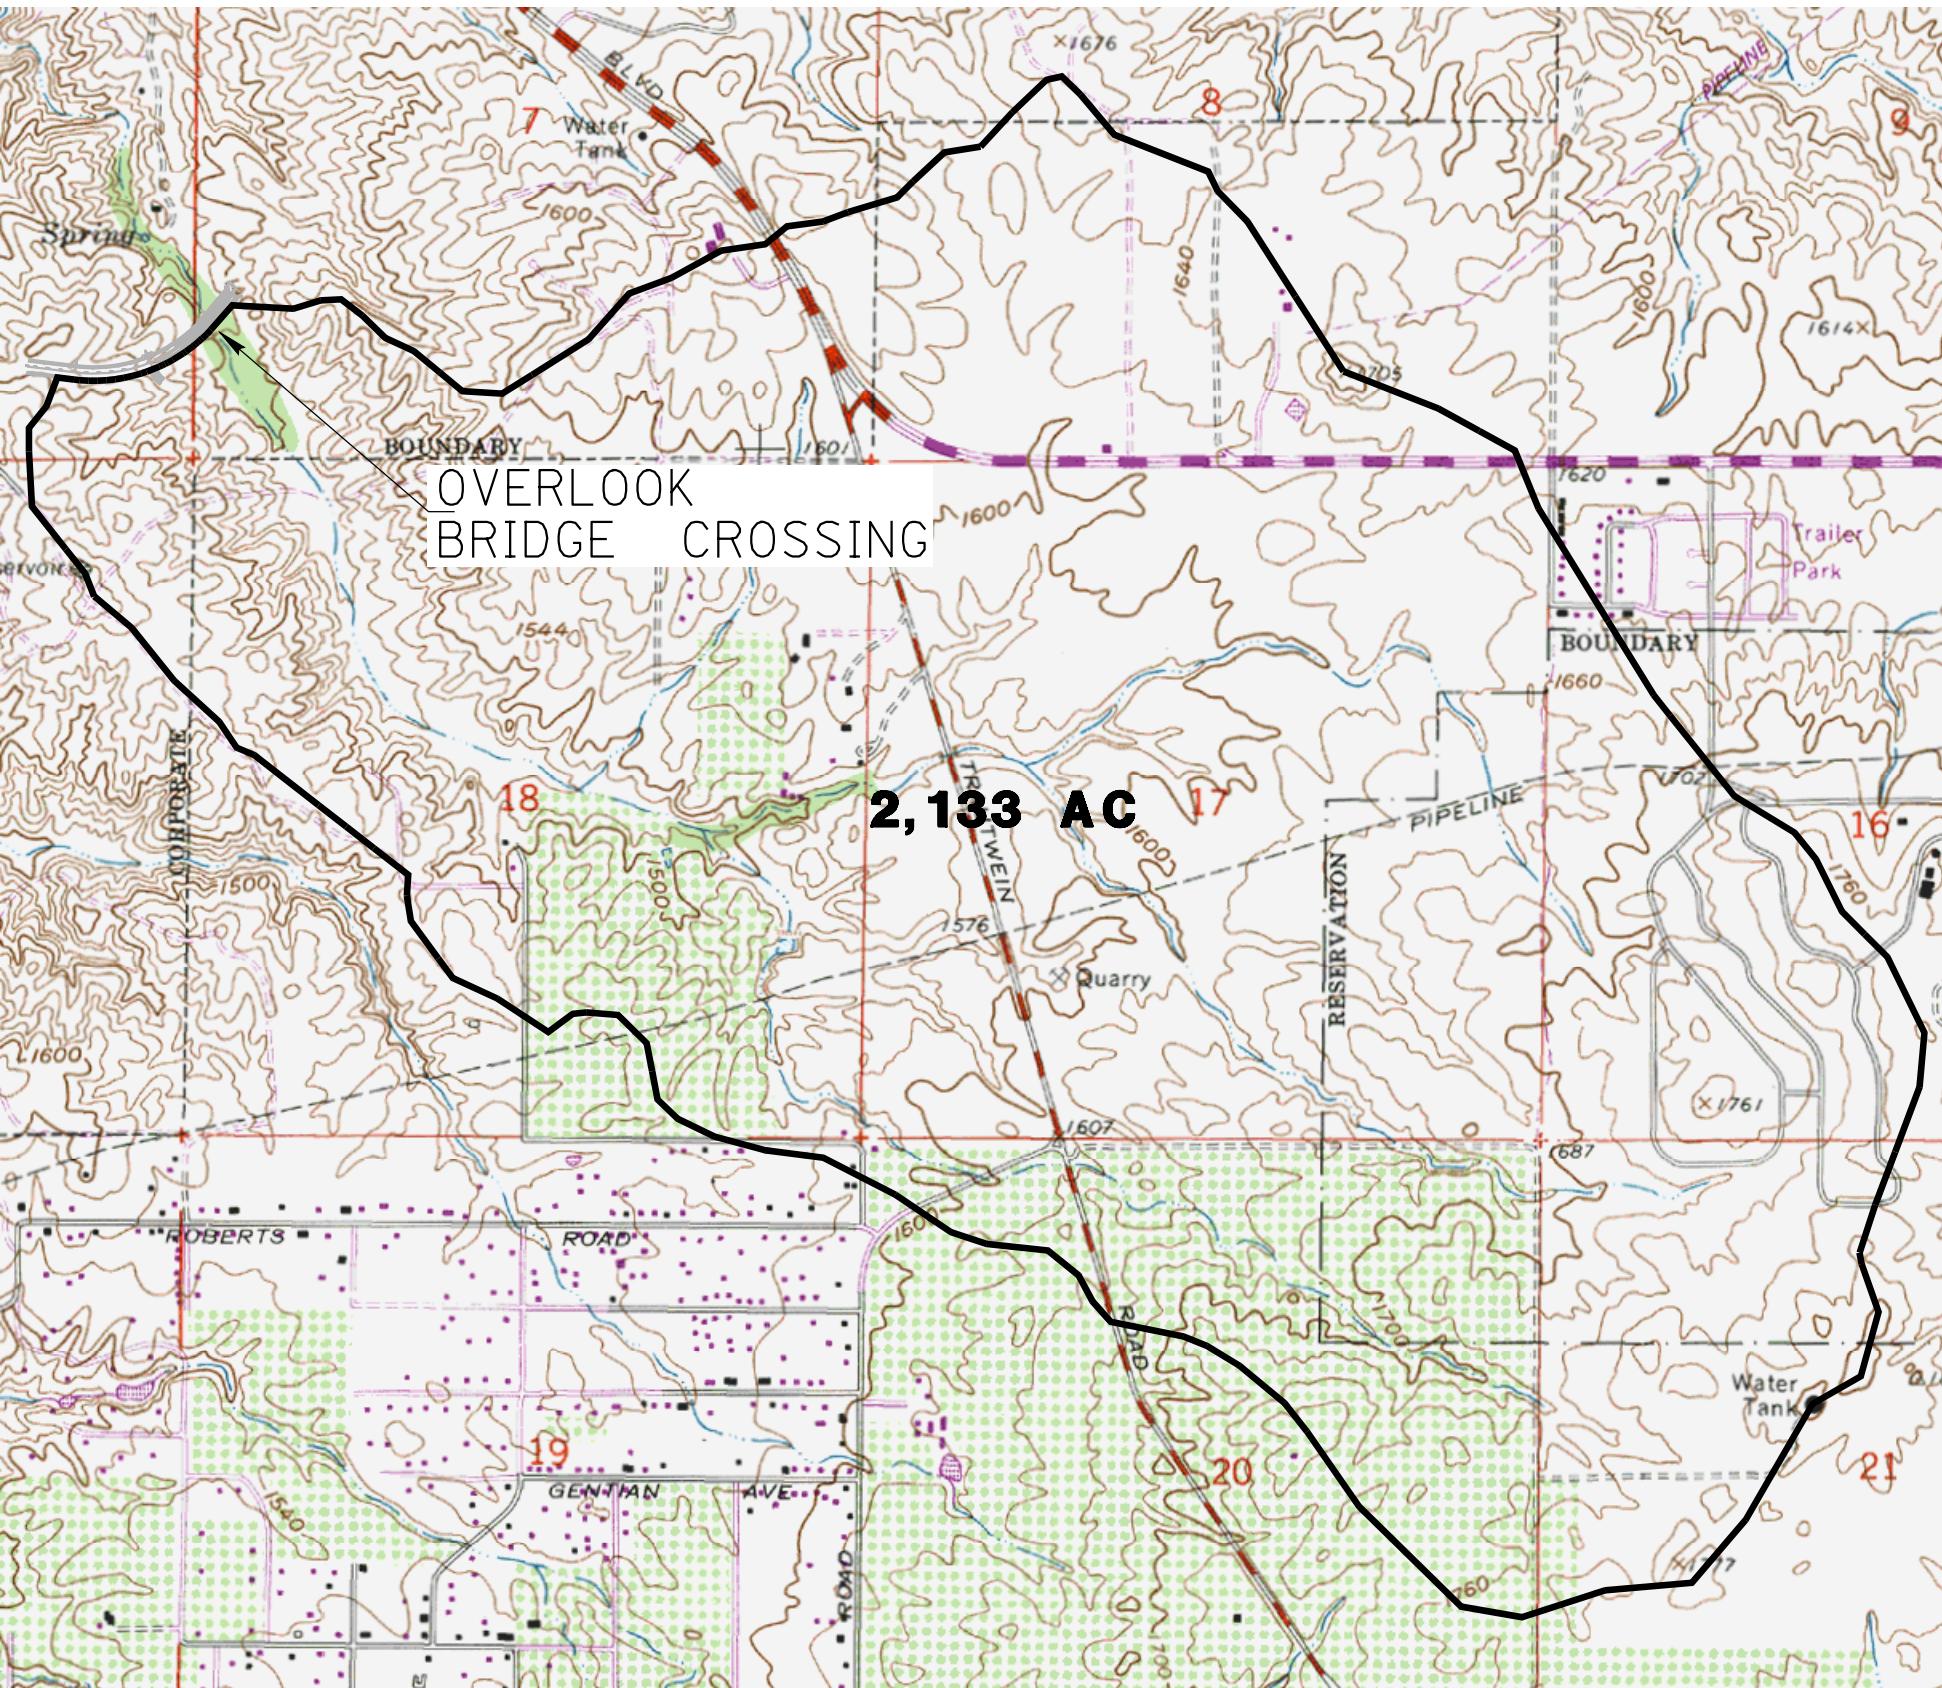

Appendix B:

- Synthetic Unit Hydrograph (SUH) backup.
- HEC-1 input
- HEC-1 output and T21 (results)

Appendix C:

- WSPGW Calculations
- WSPGW x-section exhibits
